ASSIGNMENT ONE

24/March/2023 19:25

To Lynn,

Ambasador of Ruforum2

Igniter of maintenance visits,

Vecolist,

In charge of Uganda batteries,

Crusher of processing reports,

And Queen of the Rovis realm.

Implement a logging API that keeps track of all logs created on BC.

This API is to be consumed by AL Developers.

The end user developer writes statements such as:

Log.error('something wrong has happened in the onInsert trigger');

Log.warn('This might be a bug');

Log.info('You reached the post invoice procedure');

The system creates a log entry in the database that includes the type of the log (eg info, error, warn) , the details of the error , the user logged in, and the timestamp for when the error happened.

As a sketch of what the implementation should look like, we expect you to create the following:

- 1 table (LogEntry)
- 1 page (Log Entries)
- 1 codeunit (Log)
